**Subject : Control of Radioactive Contamination**

Allegheny Ludlum has active radioactive testing programs which monitors incoming raw materials as well as melt samples for evidence of radiation. Our program for monitoring deliveries of raw materials commenced in 1996 and our program for monitoring melt samples commenced before 2000. Raw material or melt showing radiation levels above normal background are not permitted to be used. Any radioactive elements present as residuals are the results of their common occurrence in nature and are at levels not significantly above background.

A handwritten signature in black ink that reads "Tracy McFarland". The signature is written in a cursive, flowing style.
